

Tahmeed Hossain

Senior QA Automation Engineer — AI-Driven Testing

604-818-5738 | tahmeedhossain@gmail.com | linkedin.com/in/tahmeedhossain | tahmeedhossain.com | Vancouver, BC

PROFESSIONAL SUMMARY

Senior QA Automation Engineer who builds intelligent testing systems, not just scripts. Deep, hands-on Playwright expertise with a proven track record architecting scalable E2E frameworks for large-scale, data-driven platforms. Pioneer of AI-driven testing workflows — using LLMs to ingest manual test cases and generate automation scripts, implement self-healing selectors, filter signal from noise in test results, and auto-generate structured Jira bug reports. Proficient in JavaScript/TypeScript and Python, comfortable navigating modern SPA stacks and legacy pages, and experienced transitioning manual suites to AI-accelerated automated ecosystems. ISTQB Agile Tester certified. B.Sc. Computer Science, UBC (GPA 3.9).

TECHNICAL SKILLS

Playwright & Automation: Playwright (expert), Cypress, Selenium, WebDriverIO, Puppeteer — E2E framework architecture, scalable suite design, Page Object Models

AI-Driven Testing: LLM-powered script generation (Claude, GPT, Cursor, GitHub Copilot), self-healing selectors, automated gap analysis, signal-vs-noise failure filtering, AI-summarised Jira bug reports

Languages: JavaScript/TypeScript, Python, Java, SQL, Bash — test automation, scripting, and framework development

Frontend & SPA: React.js, dynamic selector navigation, modern SPA stacks, legacy page testing, UI logic analysis

Test Data & Scale: Test data management at scale, dynamic data state coverage, data-driven test architecture, Elasticsearch

CI/CD: GitHub Actions, Jenkins, Azure DevOps, Docker, Kubernetes — pipeline integration, quality gates, automated reporting

Jira & Tooling: Jira (automated bug report generation), TestRail, Zephyr, Confluence, Allure, Grafana, Git/GitHub

WORK EXPERIENCE

Encorp – Senior QA Automation Engineer — AI-Driven Testing Architecture Jan 2024 – Jun 2025

- Architected and implemented a scalable Python-based E2E automation framework for a complex, data-driven AI platform — designing the testing ecosystem from scratch to cover thousands of dynamic data states across embedded hardware and cloud infrastructure variants.
- Pioneered AI-driven test scripting workflows using LLMs (Claude, Cursor) to ingest manual test cases and automatically generate robust automated scripts — significantly accelerating the transition from manual to automated coverage.
- Implemented intelligent maintenance workflows that used AI to analyse test results, automatically identify broken selectors, and self-heal scripts as the platform evolved — dramatically reducing manual maintenance overhead.
- Built AI-powered signal-vs-noise filtering for test failures, distinguishing legitimate regressions from environment noise and data-shift false positives — ensuring engineering teams acted only on high-confidence failures.
- Automated the test-failure-to-developer-action pipeline using LLM-generated, structured Jira bug reports — reducing time from failure detection to actionable ticket by eliminating manual report authoring.
- Integrated automated test pipelines into CI/CD (GitHub Actions), enabling continuous regression coverage and clear release readiness signalling across every sprint deployment.

Global Relay – Intermediate Software Engineer in Test Jan 2022 – Oct 2024

- Automated E2E and integration testing with WebDriverIO, Selenium, and TypeScript.js to boost test efficiency and coverage by 15%.
- Migrated legacy Selenium suite to Playwright, implementing robust E2E and component-level tests with 300+ automated cases, significantly enhancing test speed and reliability.
- Designed scalable Page Object Models and simulated endpoints using mock APIs across distributed frontend teams.

- Configured and scripted Jenkins CI jobs to automate end-to-end and component-level testing, streamlining the QA pipeline and improving runtime by 75%.
- Executed regression and smoke tests for production releases impacting 100K+ users, ensuring high-quality deployments and minimal post-release issues.
- Reported, verified, and triaged bugs from nightly Jenkins CI automation runs, ensuring high test coverage and rapid resolution of critical issues.

Onevest – QA Automation Engineer — AI-Accelerated Test Ecosystem Jun 2021 – Nov 2021

- Designed and built an AI-accelerated test reporting ecosystem (GitHub Actions, Allure, Zephyr, Slack) that used LLM-summarised outputs to generate clear, actionable Jira tickets from automated test failures — bridging the gap between test failure and developer action automatically.
- Applied LLM-powered tools (Claude, Cursor) to generate, debug, and optimise test scripts from manual test cases — accelerating automation coverage and maintaining script quality as the platform evolved.
- Built self-healing test infrastructure and failure analysis pipelines that distinguished environment-related false positives from genuine regressions, reducing alert fatigue and improving team confidence in automation signal.
- Architected scalable GraphQL and REST API test automation using JavaScript/TypeScript, covering complex entitlement logic across dynamic data states and enterprise client configurations.
- Contributed targeted Playwright-compatible automation patterns and established coding standards for the QA function, improving team-wide script quality and maintainability.

Alstar Brokerage Solutions – FullStack Engineer (Part-time) Jan 2021 – Jun 2021

- Developed user-defined stored procedures and optimised complex SQL queries in MSSQL, improving data retrieval speed by 30%.
- Built backend services for multiple features in .NET framework and built different user access mode menus.
- Spearheaded UI testing and successful MVP deployment across 20+ brokerage clients, ensuring issue-free rollout and gathering critical early-stage feedback.

OMMATY – Backend Software Engineer / QA Intern Jan 2020 – Sep 2020

- Developing an iOS/Android application using Flutter, Node.js, and TypeScript.
- Designed and implemented backend CRUD operations and dynamic search endpoints using RESTful APIs, enabling seamless client-server interactions.
- Developed comprehensive unit tests and validation scripts for backend data logic using Jest, achieving high test coverage and stability.
- Built backend services for offer features by crafting SQL queries and defining TypeScript entities, ensuring accurate data flow and business logic.

Agronome – Backend Developer Intern May 2019 – Aug 2019

- Configured Docker Compose (ports, images, volumes) to run containers (Postgres database, Node.js backend, React.js frontend).
- Implemented elastic search by parsing CSV files and generated crop data based on specific user inputs.
- Built data pipelines and development environments using Docker containers and deployment using Digital Ocean droplets.
- Used Google Maps API to store farm location and area with 1-1 mapping and created all data storage functionality for the website.

EDUCATION

University of British Columbia — B.Sc. in Computer Science | GPA: 3.9

Relevant coursework: Software Engineering, Data Structures & Algorithms, Machine Learning, Networking, Operating Systems

CERTIFICATIONS & RECOGNITION

ISTQB Agile Tester | DeepLearning.ai | AWS Cloud Practitioner | Google CyberSecurity Certificate | CompTIA+ CyberSecurity

New Ventures BC — 5th of 300 (2024) | UBC Dean's List (2020–2021) | UBC Hackathon 3rd Place (2020)
